1 Introduction

The Energy Resources Conservation Board's (ERCB's) annual summary report on industry performance regarding sulphur recovery and sulphur emissions for conventional sour gas plants is published in accordance with *Interim Directive (ID) 2001-03: Sulphur Recovery Guidelines for the Province of Alberta* as part of its commitment to monitor the sulphur recovery of grandfathered¹ sour gas plants. This report covers both grandfathered sour gas plants (sulphur recovery and larger acid gas flaring sour gas plants) and nongrandfathered² sour gas plants (sulphur recovery and acid gas injection sour gas plants). Complete lists of the grandfathered and nongrandfathered plants are in Appendices 2.1 through 2.4.

While *ID 2001-03* did not change the recovery levels expected for new gas plants, it set out clear requirements on when older grandfathered plants must meet the same requirements as new plants. The ID incorporated a phased approach to the more stringent requirements and encouraged operators of sulphur recovery plants to take early action to improve performance. The ID allowed older plants that were reducing throughput by 7.5 per cent each year (and thus emissions) to continue to operate under their existing approvals until December 31, 2016, at which time grandfathering would end for all plants.

Grandfathered sulphur recovery plants that perform better than the minimum requirements specified in *ID 2001-03* have the option to file sulphur emission performance credit report forms and may use the credits to meet a portion of the sulphur recovery requirements at a future date (i.e., operate for a longer time or at a higher inlet rate before having to degrandfather the plant). All grandfathered sulphur recovery plants are taking advantage of the emission credit program, and credits continue to increase every year.

Acid gas flaring plants have no ability to earn credits and are subject to more stringent requirements over time.

In the last ten years, a number of plants have been degrandfathered:³ 16 plants have made modifications, 14 plants have been relicensed to meet the requirements for new plants, and 9 plants have ceased operating. There are 21 grandfathered plants remaining.

Sulphur emissions have decreased substantially from 2000 to 2009 for both grandfathered acid gas flaring plants (emissions down 78 per cent) and grandfathered sulphur recovery plants (emissions down 58 per cent). In the last year, emissions have decreased for both grandfathered acid gas flaring plants (emissions down 12 per cent) and grandfathered sulphur recovery plants (emissions down 13 per cent).

¹ Grandfathered plants are those that do not meet the sulphur recovery requirements for new plants listed in *ID 2001-03*. This includes some sulphur recovery plants and larger (sulphur inlet greater than 1 tonne per day [t/d]) acid gas flaring plants. All grandfathering will end by December 31, 2016.

² Nongrandfathered plants are those with an approved sulphur inlet greater than 1 t/d meeting the requirements for new plants, as listed in *ID 2001-03*. This includes both sulphur recovery plants and acid gas injection plants.

³ Degrandfathered plants are those that did not previously meet the requirements of *ID 2001-03* for new plants but have now been relicensed to meet the requirements for new plants, as set out in the ID.

2 Summary of Performance for Grandfathered Plants, 2000-2009

2.1 Grandfathered Plants That Have Been Degrandfathered

In the last ten years, 16 plants have made modifications to improve or install sulphur recovery to meet the more stringent sulphur recovery requirements for new plants. In addition, 14 other plants have been relicensed to meet these more stringent sulphur recovery requirements and 9 grandfathered plants have shut down. Further details on these plants are in Appendix 1.

When plants make modifications to their facilities or licensed operating values, they may be required to degrandfather as part of the relicensing process to meet the sulphur recovery requirements for new plants as set out in *ID 2001-03*, Table 1.

Plants degrandfathered in 2009 include

- 1) Nordegg (Brazeau River) – Keyera Energy Ltd.
- 2) Waterton – Shell Canada Limited
- 3) Zama – Apache Canada Ltd. (shut down)

As of December 2009, there were 12 grandfathered sulphur recovery plants and 9 grandfathered acid gas flaring plants remaining (see Appendix 2).

A detailed list of plants that have been degrandfathered in the last ten years is in Appendix 3, along with the process used for improving sulphur recovery.

2.2 Sulphur Emissions and Inlets at Grandfathered Plants, 2000-2009

An analysis of the sulphur emissions and sulphur inlet for the specific plants listed in *ID 2001-03* as grandfathered follows in Sections 2.2.1 and 2.2.2. For the purpose of this analysis, plants that have been degrandfathered since *ID 2001-03* was issued are included with the grandfathered plants.

2.2.1 Sulphur Emissions Reduction

The grandfathered plants substantially reduced sulphur emissions from 2000 to 2009, as shown in Figure 1.

The 62 per cent drop in emissions from grandfathered plants from the 2000 baseline year to 2009, shown in Figure 1, is due to a decrease of about 78 per cent in emissions from the grandfathered acid gas flaring plants and a decrease of about 58 per cent from the grandfathered sulphur recovery plants.

As can be seen in Figure 1, there was a significant decrease in emissions (about 13 per cent) from the grandfathered plants from 2008 to 2009. This decrease was due in part to notable improvements in sulphur recovery at Talisman Edson, Nexen Balzac (Crossfield), and Husky Strachan (Ram River), together with a decrease in inlet.

The 78 per cent decrease in emissions from grandfathered acid gas flaring plants from 2000 to 2009 was accompanied by a 43 per cent decrease in sulphur inlet. The decrease in emissions is due in part to acid gas injection facilities installed at Apache Hope Creek (Virginia Hills), ConocoPhillips Vulcan (Long Coulee), Pengrowth Judy Creek (Swan Hills South), Harvest Operations Bellshill Lake, Taylor Management Turin (Retlaw), and AltaGas Bantry and the installation of sulphur recovery at Petro-Canada Wilson Creek. Between 2000 and 2009, all 28 of the grandfathered acid gas flaring plants showed emissions reductions.

The 58 per cent decrease in emissions from grandfathered sulphur recovery facilities from 2000 to 2009 was accompanied by a 46 per cent decline in sulphur inlet. The decrease in emissions is due in large part to plant modifications and/or improved operations at Husky Ram River (Strachan), Semcams Kabob South 3, Shell Waterton, Semcams West Whitecourt (Windfall), Shell Jumping Pound, Keyera Brazeau River, and Shell Burnt Timber. Of the 28 grandfathered sulphur recovery plants, 26 reduced emissions from 2000 to 2009, as shown in Appendix 4.1.

Appendix 4 lists sulphur production and emissions for each of the sulphur recovery plants for the years 2000 and 2009.

2.2.2 Decline in Sulphur Inlet

Improvements in operation and plant modifications have played a significant role in emissions reductions at the grandfathered plants. As noted above, the overall decrease in emissions is also due to a 46 per cent decline in the sulphur inlets of these plants from 2000 to 2009, as shown in Figure 2.

As also shown in Figure 2, there was about a 19 per cent decrease in the sulphur inlets of the grandfathered plants from 2008 to 2009. This was primarily due to a decrease in throughput at four facilities: Husky Ram River (Strachan), Semcams Kaybob South 3, Shell Jumping Pound, and Semcams Kaybob South 1 and 2.

Figure 2 shows the overall decline in sulphur inlets of grandfathered gas plants.

2.3 Sulphur Emission Performance Credits

Sulphur emission performance credits (emission credits) can be earned by grandfathered sour gas plants with sulphur recovery that achieve recovery efficiencies higher than their required blended sulphur recovery efficiency. Each emission reduction credit earned may be applied as the equivalent of 1 t of sulphur not emitted. Credits may not be transferred between facilities and do not apply to acid gas flaring plants.

Credit reports can help an operator

- operate at higher sulphur inlets,
- meet the required blended sulphur recovery efficiency, and
- defer upgrading for a longer period of time.

Each emission credit represents 1 t of sulphur emissions that would have been emitted if the plant exactly met its minimum requirement. Credits must be earned before they can be used.

All plants that are able to file credit reports are doing so, and the emission credits are still increasing. As of the end of the fourth quarter of 2009, about 98 500 t of sulphur emission credits had been earned (see Figure 3 and Appendix 5). The total sulphur emissions from grandfathered sulphur recovery plants in 2009 was 23 500 t. Emission credits as of December 2009 equate to about 50 months of emissions from the grandfathered sulphur recovery plants.

Appendix 5 lists quarterly credits earned and cumulative credits for each of the grandfathered sulphur recovery plants in 2009.

3 Summary of Performance for Nongrandfathered Plants, 2000-2009

The ERCB also examined the sulphur emissions and sulphur inlet of each sour gas plant that had a sulphur inlet greater than 1 t/d and that met the requirements for new plants when *ID 2001-03* was issued.

The drop in sulphur emissions from these nongrandfathered plants was about 46 per cent between 2000 and 2009. The reduction in sulphur inlet was about 40 per cent over the same period. Details on these reductions on an individual plant basis for plants with sulphur recovery are given in Appendix 4. From 2008 to 2009, emissions dropped about 10 per cent, while sulphur inlet dropped about 9 per cent.

4 Summary of Overall Performance for Grandfathered and Nongrandfathered Plants, 2000-2009

Examining the sulphur inlet and sulphur emissions of both the grandfathered acid gas flaring and sulphur recovery facilities and nongrandfathered acid gas injection and sulphur recovery facilities reveals a 59 per cent drop in emissions from 2000 to 2009, together with a reduction in sulphur inlet of 43 per cent. From 2008 to 2009, emissions dropped about 12 per cent and sulphur inlet dropped about 14 per cent.

Appendix 1 Grandfathered Plants That Have Been Degrandfathered, 2000-2009

In the last ten years, 16 plants have made modifications to improve or install sulphur recovery to meet the more stringent sulphur recovery requirements for new plants in *ID 2001-03*. In addition, 14 other plants have been relicensed to meet these more stringent sulphur recovery requirements, and 9 grandfathered plants have shut down.

The 16 plants listed below had significant physical modifications to their plants to achieve higher sulphur recoveries.

Plants making modifications to meet the requirements for new plants

Plant name	Operator
1. Brazeau River	Keyera
2. Garrington (Olds)	Esprit
3. Homeglen (Rimbey)	Keyera
4. Bantry	AltaGas
5. Vulcan (Long Coulee)	ConocoPhillips
6. Wilson Creek	Petro-Canada
7. Rainbow	Husky
8. Edson	Talisman
9. Retlaw (Turin)	Taylor Management
10. Virginia Hills	Apache
11. Bellshill	Harvest Operations
12. Simonette	Suncor
13. Swan Hills South (Judy Creek)	Pengrowth
14. Kaybob South 3	Semcams
15. South Rosevear	Suncor
16. Nordegg (Brazeau River)	Keyera (2009)

Of the 14 plants listed below, 4 were relicensed to a higher sulphur recovery efficiency with existing equipment and/or minor modifications and 10 were relicensed to a lower throughput without modifications.

Plants relicensing to meet the requirements for new plants

Plant name	Operator
1. Okotoks (Mazeppa)	MPP
2. Crossfield East	Primewest
3. Sylvan Lake	NAL Resources
4. Sturgeon Lake	Kereco
5. Carson Creek	Pengrowth
6. Holmberg (Strome)	CNRL
7. Wilson Creek	Imperial
8. Strachan	Keyera
9. Big Bend	CNRL
10. Enchant	Taylor Management
11. Gold Creek	CNRL
12. Spirit River	Bonavista
13. Boundary Lake South	Talisman
14. Waterton	Shell (2009)

Grandfathered plants that have ceased operating

Plant name	Operator
1. North Rosevear	Suncor
2. Bittern Lake	CNRL
3. North Caroline	BP Canada
4. South Caroline	BP Canada
5. Harmattan - Elkton	Bonavista
6. Leduc - Woodbend	Imperial

(continued)

Plant name	Operator
7. West Drumheller	Penn West
8. Carstairs	Bonavista
9. Zama 1	Apache (2009)

A detailed list of plants that have been degrandfathered in the last nine years is in Appendix 3, along with the process used for improving the sulphur recovery.

As of December 2009, there are 12 grandfathered sulphur recovery plants and 9 grandfathered acid gas flaring plants remaining (see Appendices 2.1 and 2.2).

Appendix 2.1 Grandfathered Sulphur Recovery (SR) Gas Plants, 2009

		Plant Code	Current Approved Sulphur Recovery Efficiency (%)	Guideline Recovery for Approved Sulphur Inlet (%)	Approved S Inlet (t/d)	Baseline Capacity 1999 S Inlet (t/d)	Change in Status (from ID 2001-03)
1	Balzac (Crossfield) - Nexen Inc.	1050	98.0	98.5	1,730.50	414.6
